What is Australia's oil and gas trade profile?

Australia's oil and gas trade profile is paradoxical: it's a major LNG exporter yet heavily dependent on imported refined products. Exports: In 2021-22, over 85% of Australia's 891 petajoules (PJ) of crude oil, condensate, and LPG production was exported, primarily from Western Australia.

Why is Australia focusing on oil & gas exports over oil self-sufficiency?

The trade imbalance underscores Australia's focus on gas exports over oil self-sufficiency, a strategic choice shaped by geology and economics. The oil and gas sector supports around 80,000 direct and indirect jobs in Australia, with ripple effects across manufacturing and services.

Are there any unconventional oil resources in Australia?

Australia has significant undiscovered unconventional oil resources potential, including shale oil, tight oil, basin centred oil and oil shale. Oil shale is the only unconventional oil resource that has been exploited to date. Currently, there is no commercial production of oil shale resources in Australia.

How does oil form in Australia?

Oil is a liquid that forms when accumulations of organic matter are buried and exposed to increasing heat and pressure over geological time. Australia has limited identified conventional oil resources and large undiscovered prospective unconventional oil resources.

The Capreolus 3D multi-client project was the largest single 3D seismic survey ever acquired offshore Australia, and was recently completed ahead of schedule after a ...

SolarEdge Home Hub Inverter Single Phase - manages battery and system energy, in addition to its traditional functionality as a DC-optimized PV inverter. The Connection Unit, located at the ...

As most oil in Australia is produced on the North West Shelf at significant distances from our eastern Australian refineries, it is more cost effective to transport crude oil to larger refineries ...

This is intended to reduce the risk that a phase-to-cover fault will not clear. Simply earthing the cover locally may not ensure sufficient fault current to clear the fault.

4. By End-User Industry The primary end-users of corrosion inhibitors in Australia's oilfield drilling market are the oil and gas exploration and production companies.

As most oil in Australia is produced on the North West Shelf at significant distances from our eastern Australian refineries, it is more cost effective to transport crude oil to larger refineries ...

Once an ELAN interpretation is made, synthetic logs can be generated from the solution model. Reconstructed logs allow for better quality control and parameter adjustment. ELAN ...

Redeployable FPSO touted for Australia oilfield instead of newbuild as partners seek to slash capex Wellhead platform for the Santos-operated Dorado project also under review
