Will Dutch Bess capacity reach 5GW by 2030?

By 2030, total Dutch BESS capacity could potentially reach up to 5GW. This, however, will depend on investor confidence regarding the revenue potential and developments in the Dutch regulatory environment. Revenues from ancillary services are still relatively stable, but the threat of cannibalization is looming.

What balancing services does the Dutch Bess project use?

Dutch BESS projects mainly participate in two balancing services: Frequency Containment Reserve (FCR) and automatic Frequency Restoration Reserve (aFRR). The Dutch TSO, TenneT, uses these services as the primary and secondary restoration services, respectively, as explained in RaboResearch's report on the Dutch electricity sector.

What type of battery does Bess use?

Current commercial BESS solutions primarily store energy in Lithium-ion batteries of various types (NMC, LFP, LTO). The UPS solutions are slowly transitioning to Lithium-ion battery technology but mainly still use the more traditional VRLA (Valve Regulated Lead Acid) or 'valve-regulated lead-acid batteries'.

What is a Bess solution?

The BESS is a new and innovative solution that emerges from new market needs during the energy transition. ELINEX delivers complete BESS projects and (after) service in power ranges from 20kWh to 2MWh or multiples thereof. A BESS solution is a 'Power Solution', which technically has some similarities to a UPS but also significant differences.

Most BESS products on the market require an external power supply circuit for their auxiliary loads, although some have built-in circuits and do not need an external supply.

A BESS solution is completely different in application from a UPS. The UPS ensures that in the event of a
