Does green supply chain management reduce energy consumption?

The green supply chain demo project was analyzed as a quasi-experiment using PSM-Staggered DID. Green supply chain management reduces firms' energy consumption intensity. The inhibitory effect is stronger in firms with lower absorptive or adaptive capacity and non-new energy sources or high pollution.

How does energy consumption affect supply chain management?

By analyzing energy consumption in various stages of the supply chain, firms can identify key areas for improvement, such as improving logistics routes, optimizing inventory management, and enhancing production processes.

Why is supply chain management important in energy production?

1. Introduction Over the last decade, supply chain management (SCM) in energy production was driven by economic, environmental, and social impacts, through shifting the economic focus into an overall sustainability focus [1, 2].

Does sustainable supply chain management improve economic stability?

These findings highlight the crucial role of sustainable supply chain management in enhancing the positive effects of energy project development and sustainable infrastructure on economic stability.
